

Tips For Password Security

Passwords are a crucial online security measure. They protect everything from your email and social media accounts to your personal and banking information. The stronger your password, the more secure your online experience will be.

How to create a strong password:

- Never use personal information like your pet's name, date of birth, or phone number. These are easy to guess by someone trying to access your accounts.
- Use a long password as they are more difficult to guess or hack.
- Include different types of characters such as upper and lower case letters, numbers, and special characters.
